Supplementary Table 2. Results of modeling the longitudinal proteomics data set using a heterogeneous disease effect model. For each protein, the number of data points refers to the number of data points after removing the points with missing protein measurement.

	Protein name	Covariates selected using threshold 0.95 for the proportion of total explained variance.	Relevance of id.	Relevance of age.	Relevance of disease- related age.	Relevance of sex (Male/Female).	Relevance of group (Case/Control).	Noise proportion.	Largest R-hat value. A value larger than 1.05 indicates bad convergence.	Number of data points.	Number of individuals.	Number of case individuals.	Number of case individuals for which Median(β) > 0.5.	Number of case individuals for which Median(β) > 0.2.
